

 **MFG HAS A SOLUTION TO**

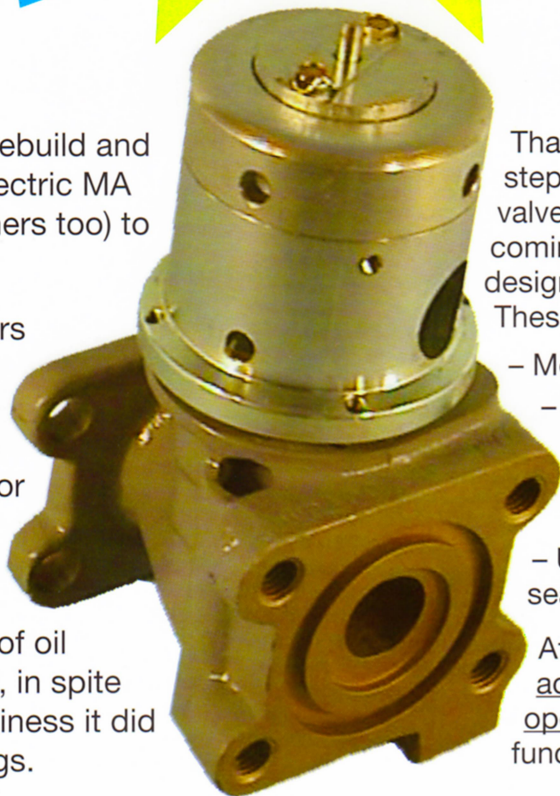

STOP

THE

Leaking

 **Mfg.** will modify, rebuild and test your General Electric MA style valves (and others too) to eliminate leaking.

The original designers created this sturdy line of valves to be the backbone of the air delivery system for many of the pneumatic operating mechanisms used to operate a variety of oil circuit breakers. But, in spite of its apparent sturdiness it did have its shortcomings.

That is why  **Mfg.** has taken steps to improve the MA style valve by eliminating those shortcomings inherent to the original design.

These steps include:

- Modifying the pilot armature
- Modifying the piston/ exhaust valve
- Eliminating the porosity in the valve body casting
- Upgrading the armature seat seal

After your valve is rebuilt it is adjusted, leak tested and operated to insure proper function.
